

NTP8835C

**High Performance, High Fidelity Power
Driver Integrated Full Digital Audio Amplifier**

**Datasheet
ver. 1.0**

General Description

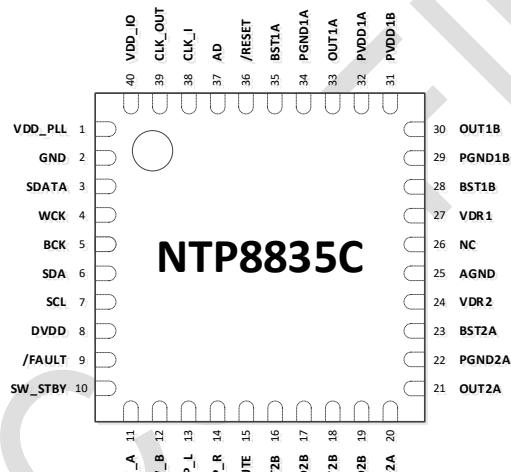

The NTP8835C is a single chip full digital audio amplifier including power stage for stereo amplifier system. The NTP8835C is integrated with versatile digital audio signal processing functions, high-performance, high-fidelity fully digital PWM modulator and two high-power full-bridge MOSFET power stages.

The NTP8835C receives digital serial audio data with sampling frequencies from 8kHz through 192kHz. It delivers 2 x 30 watts in the stereo mode with a heat sink.

The NTP8835C has a mixer and Bi-Quad filters which can be used to implement essential audio signal processing functions such as compensation of a loud speaker response and parametric equalization.

All functions of the NTP8835C can be controlled by internal register values via I²C host interface bus.

Package

(40 pin SAW QFN 6mm x 6mm Package)

Features

- 2 CH Stereo (30W x 2 BTL @24V, 4Ω)
- 2.1CH (10W x 2 + 30W @24V, 4Ω)
- SDATA Generator (I²S Output)
- Wide Operating Supply Voltage Range (5V to 28V)
- Floating Point Operation
- 25 Programmable Bi-Quad Filters
 - ✓ Speaker Compensation
 - ✓ LPF, HPF
 - ✓ Parametric Equalizer
 - ✓ Loudness Control
- 100dB Dynamic Range
- 2 Band Dynamic Range Control
- 5 Band Graphic Equalizer
 - ✓ 10 GEQs in User mode for LR
- 3D Surround
- Protection Circuit
 - ✓ OCP(Over Current Protection)
 - ✓ OTP(Over Temperature Protection)
 - ✓ UVP(Under Voltage Protection)
- High Efficiency
- Asynchronous Sample Rate Conversion
- DC cut filter

Applications

- OLED/UHD/FHD TV or Monitor TV
- Docking Station
- Mini-Component Audio Solution

3. PIN DESCRIPTIONS

PIN	NAME	TYPE	DESCRIPTION
1	VDD_PLL	P	Regulator output for PLL digital block, 1.2V
2	GND	P	This pin should be connected to Ground
3	SDATA	I	I ² S serial data input
4	WCK	I	I ² S word clock
5	BCK	I	I ² S bit clock
6	SDA	I/O	I ² C data
7	SCL	I	I ² C clock
8	DVDD	P	Regulator output for Core block, 1.2V
9	/FAULT	I	Active low to reset internal power stage, Pull-up
10	SW_STBY	O	External power device standby control
11	SW_A / MONITOR_0	O	Sub-Woofe_A/Monitoring signal out from processor block
12	SW_B / MONITOR_1	O	Sub-Woofe_B/Monitoring signal out from processor block
13	HP_L	O	Left audio channel Headphone signal
14	HP_R	O	Right audio channel Headphone signal
15	HP_MUTE	O	External Headphone mute signal
16	BST2B	P	Bootstrap supply, external capacitor to OUT2B is required
17	PGND2B	P	Ground
18	OUT2B	O	Power stage PWM output 2B
19	PVDD2B	P	Power supply for PWM Power stage 2B
20	PVDD2A	P	Power supply for PWM Power stage 2A
21	OUT2A	O	Power stage PWM output 2A
22	PGND2A	P	Ground
23	BST2A	P	Bootstrap supply, external capacitor to OUT2A is required
24	VDR2	P	Gate drive voltage regulator decoupling pin, capacitor to GND is required
25	AGND	P	Ground
26	NC	-	No connection
27	VDR1	P	Gate drive voltage regulator decoupling pin, capacitor to GND is required
28	BST1B	P	Bootstrap supply, external capacitor to OUT1B is required
29	PGND1B	P	Ground
30	OUT1B	O	Power stage PWM output 1B
31	PVDD1B	P	Power supply for PWM Power stage 1B
32	PVDD1A	P	Power supply for PWM Power stage 1A
33	OUT1A	O	Power stage PWM output 1A
34	PGND1A	P	Ground
35	BST1A	P	Bootstrap supply, external capacitor to OUT1A is required
36	/RESET	I	Active low to reset NTP8835C, Schmitt trigger input
37	AD	I	I ² C device address selection
38	CLK_I	I	System master clock input
39	CLK_OUT	O	System master clock output
40	VDD_IO	P	Power supply for digital interface I/O, 3.3V
-	Thermal Pad	P	This pad should be connected to Ground

P = Power Supply or Ground, I = Input, O = Output, I/O = Input / Output

Table 1. NTP8835C Pin Description

4. CHARACTERISTICS AND SPECIFICATIONS

4.1. Absolute Maximum Ratings

Parameter	Reference	Rating	Unit
DVDD voltage	DGND	-0.3 ~ 1.5	V
VDD_IO voltage	GND_IO	-0.3 ~ 5.25	V
Logic input voltage	GND	-0.3 ~ 5.25	V
Logic output voltage	GND	-0.3 ~ 5.25	V
PVDDXX voltage	PGNDXX	30	V
OUTXX voltage	PGNDXX	-0.3 ~ PVDDXX	V
BSTXX voltage	PGNDXX	36.0	V
VDRX voltage	PGNDXX	-0.3 ~ 6.0	V
Junction Temperature	T _J	150	°C

4.2. Recommended Operating Conditions

Parameter	Reference	Min	Typ	Max	Unit
VDD_IO voltage	GND_IO	3.0	3.3	3.6	V
PVDDXX voltage	PGNDXX	5		28	V
VDRX voltage	PGNDXX		5.1		V
Ambient operating Temperature	T _{AMB}	-25		85	°C

4.3. DC Electrical Characteristics

Parameter	Symbol	Condition	Min	Typ	Max	Unit
Logic Block (VDD_IO=3.3V, T_A=+25°C, unless otherwise specified.)						
Input High voltage	V _{IH}	-	2.0			V
Input Low voltage	V _{IL}	-	-0.5		0.8	V
Schmitt trig. Low to High threshold point	V _{T+}	-	2		3.6	V
Schmitt trig. High to Low threshold point	V _{T-}	-	-0.5		0.8	V
Input current	I _I	V _{IN} =V _{IL} MAX, DVDD=MIN	-50			uA
		V _{IN} =V _{IH} MIN, DVDD=MIN			50	uA
Input leakage current	I _L	V _{IN} =VSS, DVDD=MIN	-10		10	uA
Output Low voltage	V _{OL}	I _{OL} = -4mA	0		0.4	V
Output High voltage	V _{OH}	I _{OH} = 4mA	2.4		3.6	V
LDO output voltage	V _{LDO}	DVDD	1.08		1.32	V
Power Driver Block (PVDD=24V, T_A=+25°C, unless otherwise specified.)						
Current consumption	I _{CC}	VDD_IO=3.3V, No Input, No Load		30		mA
	I _{PVDD}	PVDD=24V, No Input, 8 Ω Load with 10uH		95		
Peak current limit	OCP	-		6		A
Thermal shutdown temperature	OTP-		140	150	160	°C
Under voltage protection limit	UVP	-		4.2		V

4.4. PLL Input Parameters and External Filter Components

Parameter	Min	Typ	Max	Unit
MCLK frequency range	2.048		49.152	MHz
MCLK duty cycle	20	50	80	%
Rise/fall time for MCLK			5	ns
MCLK square wave jitter			0.1	UI
External PLL filter capacitor C10		220		nF
External PLL filter capacitor C11		22		nF
External PLL filter resistor R13		220		Ω

4.5. Performance Specification

Parameter	Condition	Min	Typ	Max	Unit
SNR	AES17, A-weighting filter		95	100	dB
THD+N	1W, 1kHz		0.1		%
P _{OUT}	Peak output power		30		W
Cross talk			67		dB
Output noise voltage	P _{VDD} =24V		500		uV
Efficiency	P _{VDD} =12V, P _{OUT} =15W@ 6Ω, THD 1%		90		%
PWM frequency			384		KHz

4.6.1 Switching Characteristics – I²C Control

Parameter	Symbol	Condition	Min		Max	Unit
I²C Control Port						
SCL clock frequency	F _{scl}		-		400	kHz
Hold time for START condition	T _{hdsta}		600		-	ns
Low period of the SCL clock	T _{low}		1300		-	ns
High period of the SCL clock	T _{high}		600		-	ns
Rise time of SDA and SCL signals	T _{rise}		-		300	ns
Fall time of SDA and SCL signals	T _{fall}		-		300	ns
Setup time for STOP condition	T _{susto}		600		-	ns

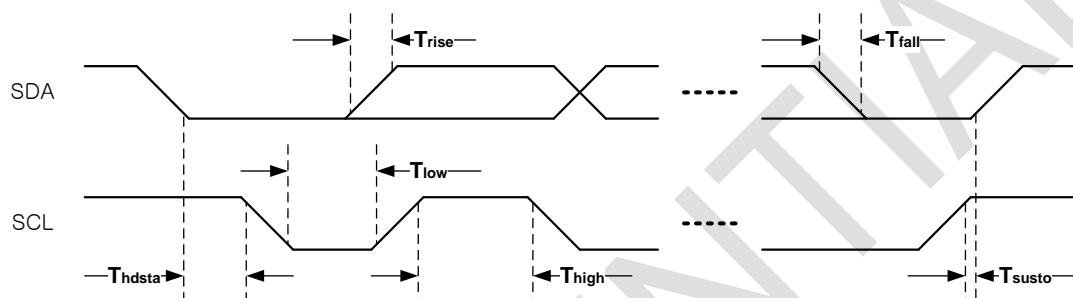

Figure 3. I²C Mode Timing

4.6.2 Switching Characteristics – Audio Interface

Parameters	Symbol	Min	Max	Unit
BCK high time	t_{bh}	20	-	ns
BCK low time	t_{bl}	20	-	ns
SDATA setup time before BCK rising edge	t_{ds}	10	-	ns
SDATA hold time after BCK rising edge	t_{dh}	10	-	ns
WCK setup time before BCK rising edge	t_{ws}	20	-	ns
BCK rising edge before WCK edge	t_{wh}	20	-	ns
BCK falling edge before WCK edge	t_{wl}	-20	20	ns
Rising/Falling time for BCK/WCK	$t_{br}/t_{bf}/t_{wrf}$	-	50	ns

* Schmitt trigger characteristics (V_{SIH} Min = 1.85V, V_{SIH} Max = 0.9V)

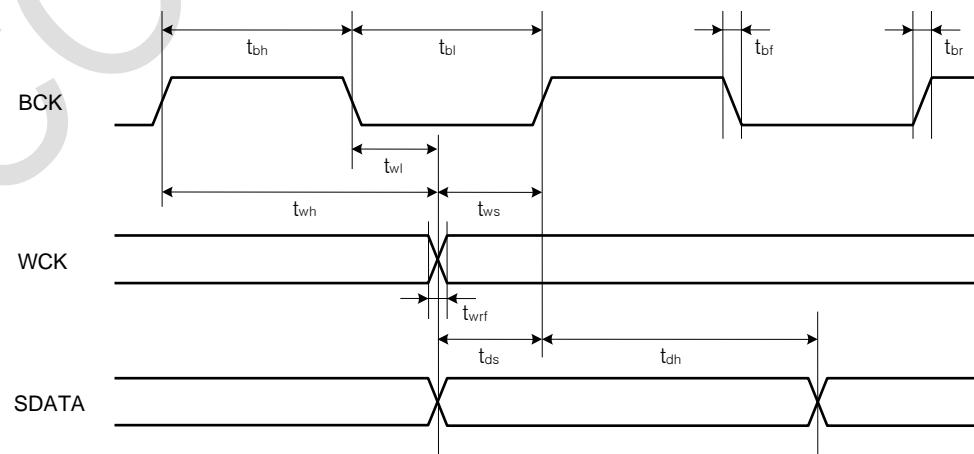

Figure 4. Audio Interface Timing

5. I²C BUS OF NTP8835C

The NTP8835C uses an industry standard Inter IC Control (I²C) bus to communicate with host IC. A host IC can write or read internal registers of the NTP8835C via the I²C bus.

5.1. General Description of I²C Bus

The I²C bus uses two signal lines – a serial clock line (SCL) and a serial data line (SDA). Because the SDA line is open-drain type port, both the NTP8835C and a host IC can only drive these pins low or leave them open.

In I²C bus, a master device means the device which generates serial clock on the SCL. A slave device means the device which receives serial clock. There can be many master and slave devices on an I²C bus. But, when one master device works on the bus, the other master devices should not generate signal on the lines. These unexpected interrupts can make other slave devices to fail to communicate with the master device.

The NTP8835C supports only slave mode of I²C bus. So, the NTP8835C always receives serial clock from a host IC. The slave mode is enough to write/read data to/from the NTP8835C.

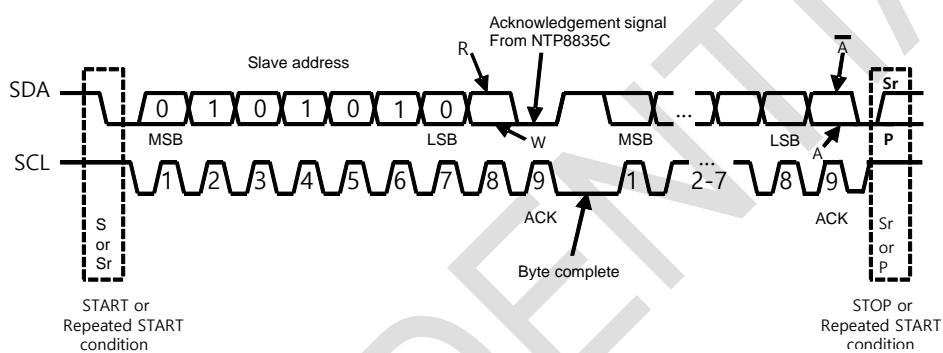

Figure 5. Basic Signaling Elements of I²C Bus

If there is no communication on I²C bus, two signal lines must keep in high state. I²C bus begins communication with the start condition and ends communication with the stop condition. The start condition can be generated by changing the SDA state high to low, during the SCL state remains in high. The stop condition can be generated by changing the SDA state low to high during the SCL remains in high state. Be aware that the stop condition always reset the internal status of I²C bus control logic. Except these two conditions, the SDA may not change during the SCL in high state. Otherwise, abnormal start or stop condition will be generated.

I²C bus transfers the MSB (most significant bit) of a byte on 1st data slot and the LSB (least significant bit) of a byte on 8th data slot. I²C bus checks success or fail of transfer on every 1 byte transfer. The device which found an expected data on SDA must generate acknowledgement (keep low on SDA) on 9th clock. If there is no acknowledgement on 9th clock, the device which generated a data on SDA may stop transfer. The NTP8835C will generate acknowledgement for every successful data transfer of 1 byte in write mode. But, in read mode, because data is generated by the NTP8835C, the NTP8835C will not generate an acknowledgement. In this case, on the contrary, the NTP8835C will check SDA state on 9th clock that the master device received a read data properly.

Last 8th bit of the 1st byte is used to indicate whether the master device want to write or read data.

5.1.1. Writing Operation

When last 8th bit of the 1st byte is set to low state, the writing operation of I²C bus begins. The NTP8835C supports 3 kinds of writing operations which are presented on **Figure 6**.

The type presented on **Figure 6-(a)** is single byte write operation. "Sub Address" on 2nd byte means the internal register address of the NTP8835C. The "Data" on 3rd byte will be written into the internal register address on "Sub Address". If the stop condition is not generated, writing "Data" on specific "Sub Address" can be repeated like **Figure 6-(b)**. "Data #n" will be written on "Sub Address #n".

The type presented on **Figure 6-(c)** is burst byte write operation under address auto increment mode. The AIF on 1st bit of 2nd byte is the address auto increment flag. If SDA is set to high state on AIF slot, the NTP8835C writes data continuously with register addresses which are increased from initial "Sub Address" for every byte; "Data #n" will be written on "Sub Address" + n - 1. The internal address will cycle automatically.

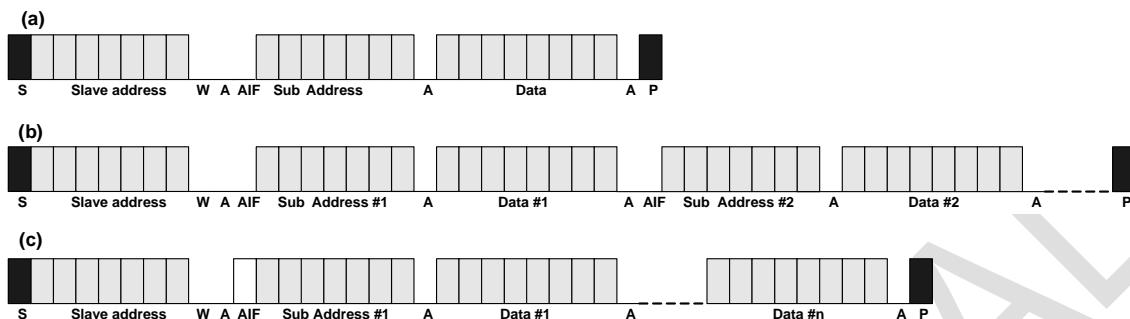

Figure 6. Single Byte Write Mode Sequence

Figure 7-(a), Figure 7-(b), and Figure 7-(c) represent 4 byte writing operations. Coefficient mode address 0x00~0x6B are used to configure Bi-Quad filter coefficients, loudness filter gains and DRC attack gain. The data size of these coefficients and gains is 4 byte for each. The difference between 4 byte writing operation and single byte writing operation is only the size of transferring data. So, after sending "Sub Address", 4 sequential bytes must be transferred from the MSB(most significant byte) to the LSB(least significant byte) sequence.

The type presented on **Figure 7-(c)** is quad byte write operation under address auto increment mode, AIF function. Please compare the data transfer size between **Figure 6** and **Figure 7**.

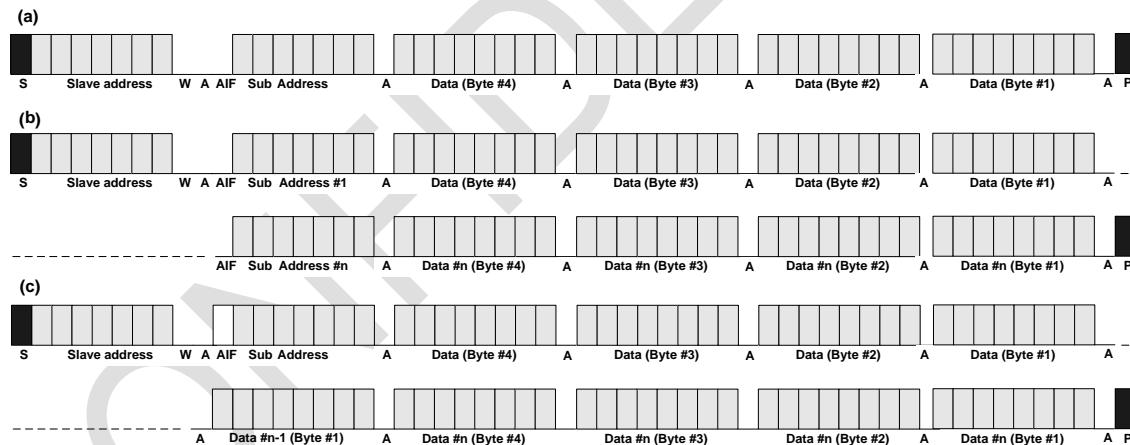

Figure 7. Quad Byte Write Mode Sequence

In write operation, the address 0x7E register needs to be set first for performing the configuration of the registers. If the 0x7E register is configured to 0x00, the NTP8835C supports byte write operation. Otherwise, 4 byte writing operation is supported.

Each Bi-Quad filter uses 5 coefficients. Any unexpected coefficient value changes on any part of 5 coefficients can generate unstable Bi-Quad filter response. For example, if only one of 5 coefficients for a Bi-Quad filter is changed and downloaded, its combined 5-coefficient set can have unstable operation while old and new coefficients are mixed together. Therefore to prevent this kind of problem, the NTP8835C writes coefficients to coefficient memory only when the last 5th coefficients of each Bi-Quad filter is downloaded, which means all of 5 coefficients are fully ready. Please refer to 9.1 for more detailed operation.

5.1.2. Reading Operation

Figure 8-(a) represents single byte reading operation from the NTP8835C. To read data from the NTP8835C, generate the start condition to start transfer. After then, send “Slave Address” with write mode flag and send the register address(Sub Address). By regenerating start condition (Sr) again and transferring “Slave Address” with read mode flag, reading operation begins. The NTP8835C will generate data on SDA signal synchronizing with serial clocks on the SCL. Because the SDA signal is generated from the NTP8835C, the master device must generate ACK on 9th slot to confirm that the master received 1 byte successfully. However, if this is just one byte reading operation, NAK (not acknowledged) signal must be generated. Then the stop condition must be generated to end transfer.

When the AIF is set to high on “Sub Address” like Figure 8-(b), data will be read continuously with register addresses which are increased from initial “Sub Address” for every byte. To continue reading operation in this case, the master must generate ACK signal on every 9th slot to confirm that the master received 1 byte successfully. Otherwise, reading operation will be terminated. To end address auto increment reading operation, generate NAK on 9th slot and the stop condition.

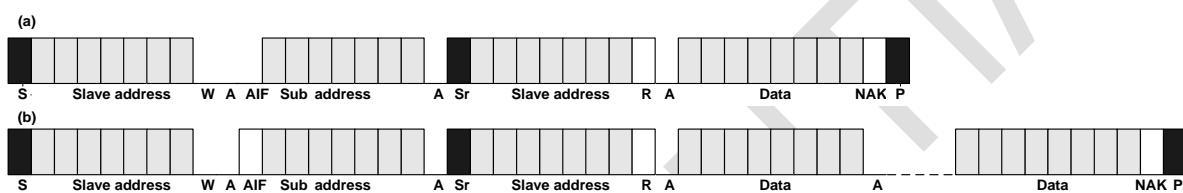

Figure 8. Single Byte Read Mode Sequence

Figure 9 represents quad byte reading operation. The difference between quad byte reading operation and single byte reading operation is only the size of receiving data. So, after sending “Sub Address”, 4 sequential bytes must be received from the MSB to the LSB sequence.

The type presented on **Figure 9-(b)** is quad byte read operation under address auto increment mode, AIF function. Please compare the data receive size between **Figure 8** and **Figure 9**.

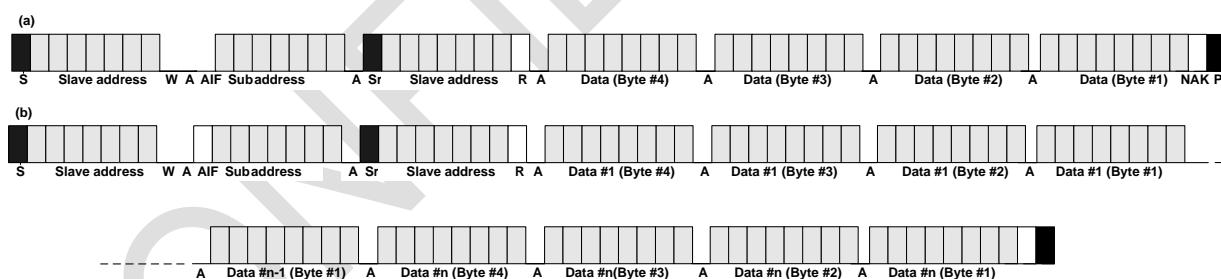

Figure 9. Quad Byte Read Mode Sequence

As mentioned above at Writing Operation, the address 0x7E register must be set as proper value for single or quad byte reading operation.

5.2 I²C Glitch Filter

To clean out the threats of noise in today's high-speed-board system, the NTP8835C has a glitch elimination filter on the I²C ports. Glitches in the transmission lines of the I²C port can be safely removed with this function. Please refer to the register 0x39.

5.3. I²C Slave Address

The NTP8835C supports up to four slave addresses. So, four NTP8835C can be connected to the same MCU at the same time. For multi-chip operation, use the proper I²C slave address according to AD pin and the initial state of MONITOR_0 pin as shown in **Table 2**.

MONITOR_0 Pin				
Pin name	Value	Pull-down ('L')	Pull-up ('H')	No pd / pu (default: 'L')
AD	0	Addr : 0x54	Addr : 0x58	Addr : 0x54
	1	Addr : 0x56	Addr : 0x5A	Addr : 0x56

Table 2. I²C Slave Address

6. CLOCK, RESET & CONTROL

6.1. System Clock

The internal system clock of the NTP8835C is generated from an external master clock by the on-chip PLL. The NTP8835C supports external master clock frequency from 2.048MHz to 24.576MHz. For proper operation, the registers for the PLL should be set correctly according to master clock frequency (Address 0x02).

6.2. Timing Sequence 1 (recommend)

For proper power up, initialization and power down of the NTP8835C, it is recommend to use the following sequence as shown in **Figure 10**.

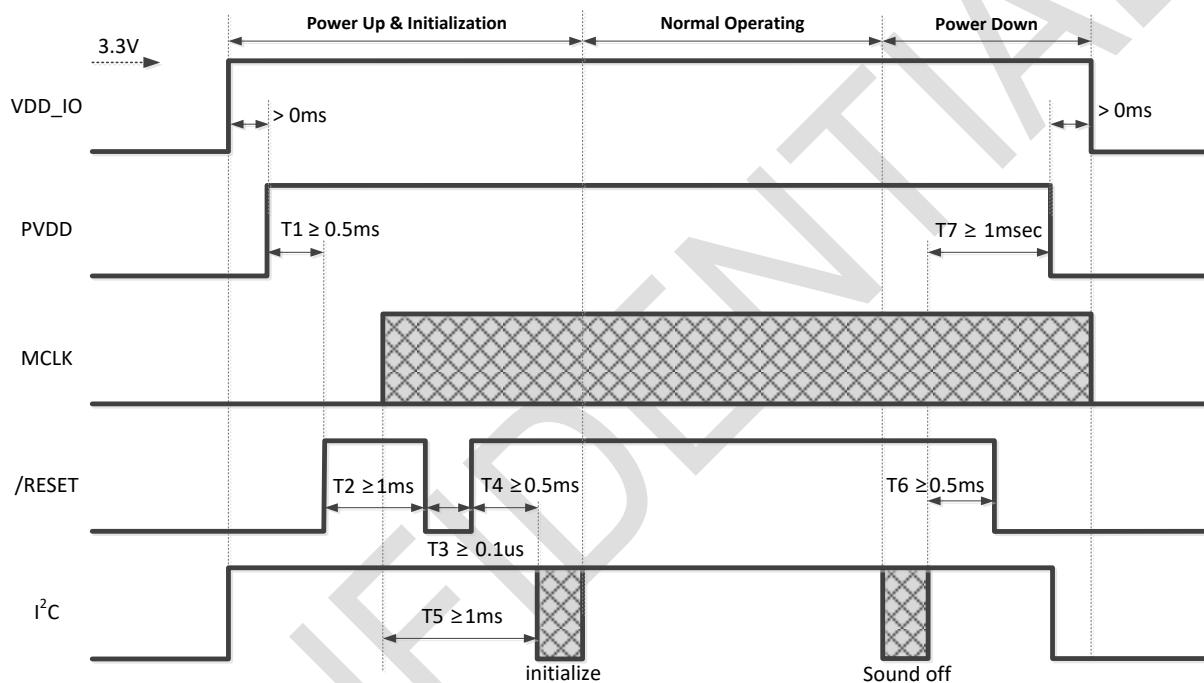

Figure 10. Timing Sequence 1

6.2.1. Power-Up & Initialization Sequence

- 1) Ramp up **VDD_IO** to at least 3.3V.
- 2) Ramp up **PVDD**.
- 3) After 0.5msec ($T_1 \geq 0.5\text{msec}$), drive **/RESET** = High, and then wait for at least 1msec ($T_2 \geq 1\text{msec}$).
- 4) Hold **/RESET** Low for at least 0.1usec ($T_3 \geq 0.1\text{usec}$)
- 5) Drive **/RESET** = High, and then wait for at least 0.5msec for **I²C** communication ($T_4 \geq 0.5\text{msec}$).
- 6) **MCLK** signal should arrive at least 1msec before **I²C** initialization sequence ($T_5 \geq 1\text{msec}$).
- 7) Execute both amp initialization sequence (e.g. clock, volume, DRC, PEQ setup) and sound on sequence.

6.2.2. Power-Down Sequence

- 1) When both DC and AC power are off, make sure to execute sound off sequence.
- 2) Switch **/RESET** to Low after sound off sequence ($T_6 \geq 0.5\text{msec}$).
- 3) **MCLK** and **I²C** should be Low after sound off sequence ($T_7 \geq 0.5\text{msec}$).
- 4) After **I²C** is Low, ramp down **VDD_IO**.

6.3. Timing Sequence 2 (reference)

Following figure illustrates another timing sequence, which is conforming to the legacy reset timing.

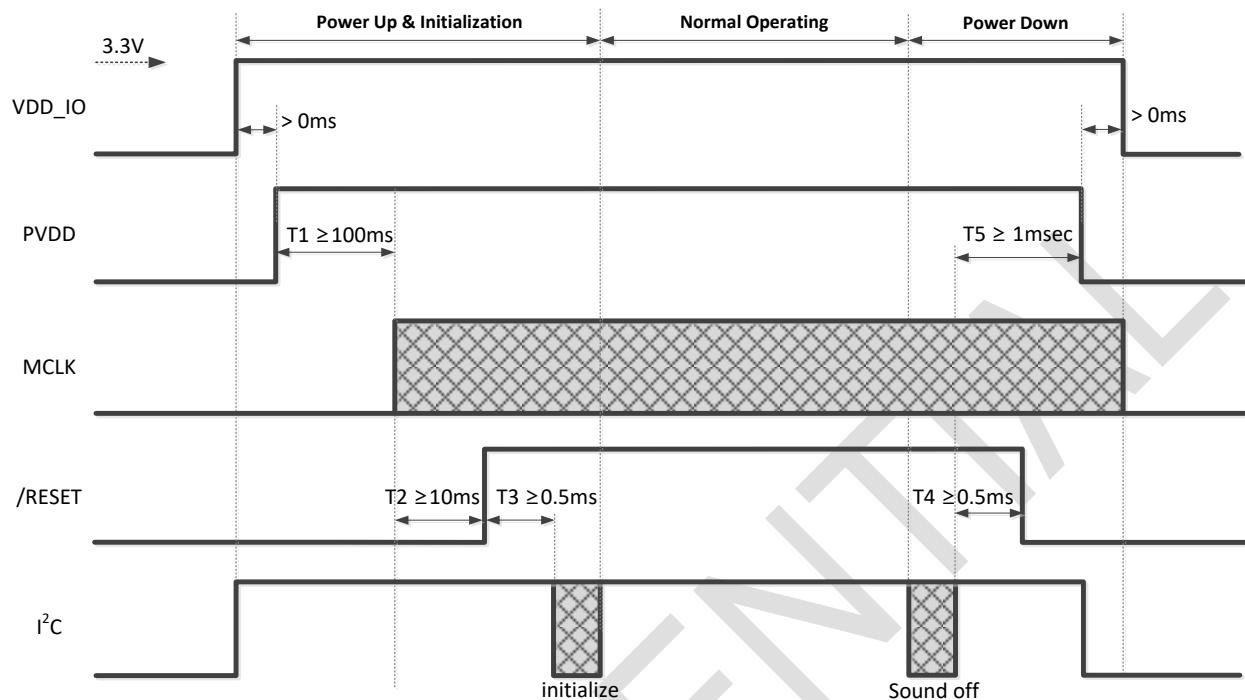

Figure 11. Timing Sequence 2

6.3.1. Power-Up & Initialization Sequence

- 1) Ramp up VDD_{IO} to at least 3.3V.
- 2) Ramp up PVDD.
- 3) Drive MCLK signal at least 100ms after PVDD (T1≥100msec).
- 4) At least 10ms after MCLK, Drive /RESET = High(T2≥10msec).
- 5) Wait for at least 0.5msec for I²C communication (T3≥0.5msec) and keep the status.
- 6) Execute both amp initialization sequence (e.g. clock, volume, DRC, PEQ setup) and sound on sequence.

6.3.2. Power-Down Sequence

- 5) When both DC and AC power are off, make sure to execute sound off sequence.
- 6) Switch /RESET to Low at least 0.5 msec after sound off sequence (T4≥0.5msec).
- 7) Ramp down PVDD at least 1 msec after sound off sequence (T5≥1msec).
- 8) After I²C is Low, ramp down VDD_{IO}.

6.4. Sound On/Off Sequence

For proper sound on/off of NTP8835C, use the following sequence as shown in **Figure 12**.

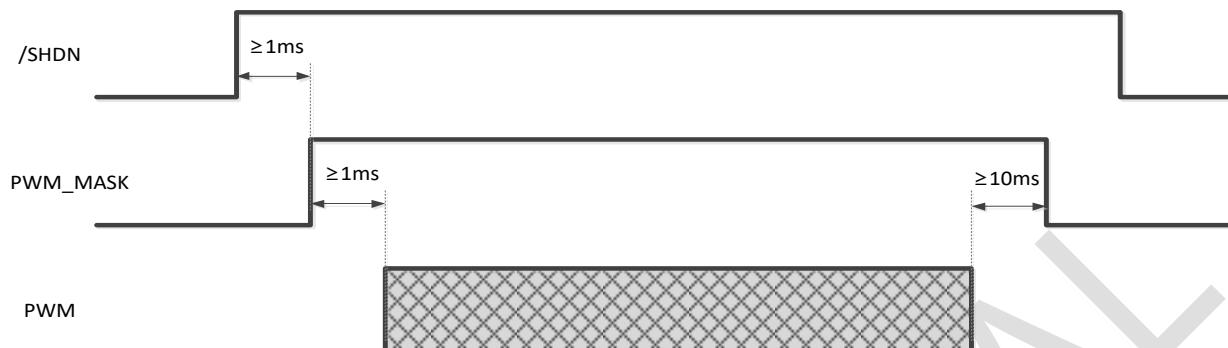

Figure 12. Sound On & Off Sequence

To prevent pop noise when enabling or disabling the amplifier, the above sequences are recommended.

6.4.1. 2-channel Sound On/Off Sequence

A. Sound On Sequence

To turn on the amplifier, first, make the PWM mask high, and then turn on the PWM switching. Finally, apply the soft mute for increasing the output. The register settings are 0x04@0x28, 0x00@0x27, and 0x00@0x26, respectively.

B. Sound Off Sequence

To turn off the amplifier, reverse the sequence of the sound on; that is to say, apply the soft mute for decreasing the output, turn off the PWM switching, and make the PWM mask low. The register settings are 0x07@0x26, 0x07@0x27, and 0x06@0x28, respectively.

6.4.2. 2.1-channel Sound On/Off Sequence

A. Sound On Sequence

The only difference from the 2-channel sound on sequence is that the PWM switching on of the channel 3 should be applied after the channel 1 and 2. Therefore, the sound on sequence for 2.1-channel is as follows: firstly, make the PWM mask low, and, secondly, turn on the PWM switching for channel 1 and 2. Thirdly, turn on the PWM switching for channel 3, and finally, apply the soft mute for increasing the output. The register settings are 0x04@0x28, 0x04@0x27, 0x00@0x27, and 0x00@0x26, respectively.

B. Sound Off Sequence

The sound off sequence is exactly the same as that in the 2-channel case.

7. AUDIO INPUT

7.1. I²S and Serial Audio Interface

The NTP8835C receives audio data through digital audio interface. There are 2 different formats generally used in digital audio interface - the Inter-IC Sound (I²S) Interface and General Serial Audio Interface (GSA). These two interfaces have some common features.

This interface uses 2 clock lines and 1 data line to transfer audio data. One of these clock lines is WCK. A period of WCK is same with sampling period of audio data i.e. 64bits (32bits for each channel). One of the main functions of WCK defines the channels, the low state of WCK indicates the 1st channel i.e. left channel and the high state indicates the 2nd channel i.e. right channel. This feature enables the clock receiving device to synchronize the data word-wise for transmitting or receiving from clock generating device.

The other clock line is BCK. This clock line is used to synchronize the bit-wise data. The number of BCK clock during one WCK period can be configurable. The name of data transfer line is SDATA. The data being synchronized with BCK must be loaded on this line. The NTP8835C receives data on the rising edge of BCK. The bit range for I²S is predefined. Please refer to in **Figure 13**.

7.1.1. I²S Glitch Filter

To clean out the threats of noise in today's high-speed-board system, the NTP8835C has a glitch elimination filter on the I²S ports. Glitches in the transmission lines of the I²S port can be safely removed with this function. Please refer to the register 0x61.

7.2. SDATA Generator

The SDATA generator of NTP8835C sends out I²S out signals. In order for SDATA out process to function stably, the falling of BCK should either synchronize or occur ahead of falling or rising of WCK. Since SDATA generation is synchronous to the input WCK and BCK signals, NTP8835C must be in a slave mode from the point of the I²S signals. Additionally, the master of I²S signals, and NTP8835C should be synchronous. In other words, they have to use the same system clock source to generate SDATA from NTP8835C.

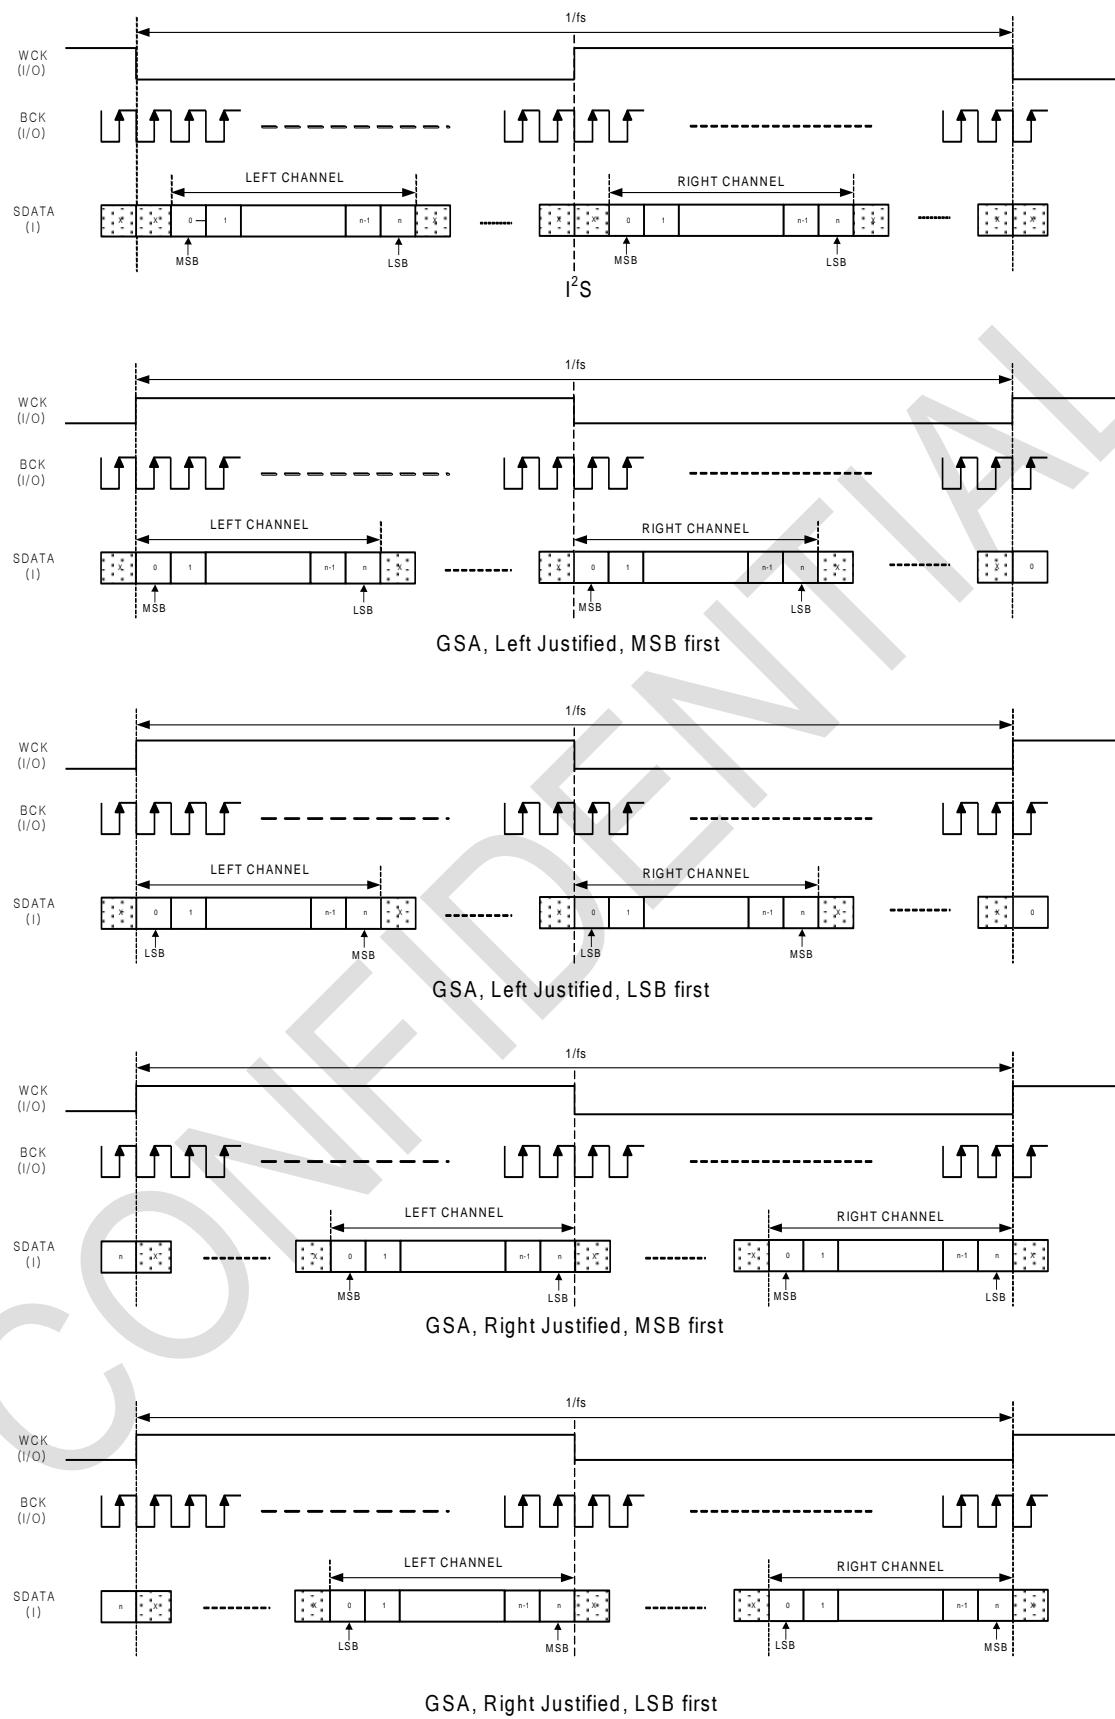

Refer to the register address 0x5F in the **Appendix A** and refer to the **4.6. Switching Characteristics – Audio Interface**.

7.3. Asynchronous Sample Rate Conversion

NTP8835C provides ASRC(Asynchronous Sample Rate Conversion) for input data sample rate from 8kHz to 192kHz.

ASRC can give seamless data continuity when clock sources of input I²S and MCLK are different. Another benefit of ASRC is audio processing can be done without any change of register settings when there happens an alteration in the input sample rate.

If ASRC is to be used, the LSB of 0x56 register, i.e. BYPASS, should be set as '0'. The default setting of BYPASS in the 0x56 register is '1', which means ASRC is disabled and synchronous conversion is applied.

**Figure 13. Serial Audio Interface Format**

8. MIXER

Channel mixer can be used in lots of application needs like pseudo stereo and etc. User can mix input channels into each output channels with designated gains and polarity. Step size of mixer gain is variable according to the gain level as shown below.

Volume Range (dB)	Step (dB)
+18 ~ +6	1
+5.5 ~ -5.5	0.5
-6 ~ -32	1
≤ 32	-∞

Table 3. Variable Step Mixing Gain

In total, 6 mixing gain coefficients denoted as M[0x03], M[0x04], M[0x05], ... M[0x08] are defined as shown in the equation below. Each Mxx stores volume value in dB scale, and the number values versus gain in dB are shown in the **Appendix B**.

$$[\text{Output Channels}] = [\text{Mixer Matrix}] \times [\text{Input Channels}]$$

$$\begin{bmatrix} \text{CH1 OUT} \\ \text{CH2 OUT} \\ \text{CH3 OUT} \end{bmatrix} = \begin{bmatrix} \text{M}[0x03] & \text{M}[0x04] \\ \text{M}[0x05] & \text{M}[0x06] \\ \text{M}[0x07] & \text{M}[0x08] \end{bmatrix} \bullet \begin{bmatrix} \text{CH1 IN} \\ \text{CH2 IN} \end{bmatrix}$$

Figure 14. Mixer Matrix

In order to load mixer coefficients into internal memory, send the index value in the gain value table to the register address 0x03 ~ 0x08.

9. PRE-PROCESSING

9.1. Pre Bi-Quad Filter Chain

The NTP8835C has two kinds of Bi-Quad filter chains. One is pre Bi-Quad filter chain and the other is post Bi-Quad filter chain for bass management, loudness control, loud-speaker EQ, etc.

Pre Bi-Quad filter chain consists of two 2nd order Bi-Quad filters as shown in **Figure 15**.

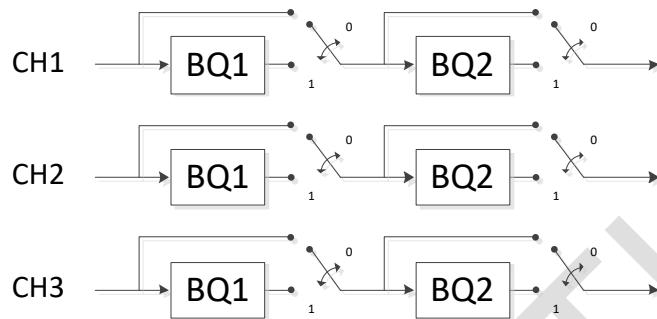

Figure 15. Pre Bi-Quad Filter Structure

Filter coefficients are 32-bit floating point numbers and can be downloaded thru I²C interface. To download the pre Bi-Quad filter coefficients to internal memory of NTP8835C, designer should change the flags of register address 0x7E to 'enable coefficient write' status.

When CH1(or CH2 or CH3) Flag of register address 0x7E is set to 1, coefficient mode register address 0x00~0x04 designates the coefficients of 1st Bi-Quad filter of channel 1(or channel 2 or channel 3) and indicates b0, b1, b2, a1, a2 respectively. And coefficient mode register address 0x05~0x09 designates the coefficients of 2nd Bi-Quad filter of channel 1(channel 2 or channel 3).

The Bi-Quad filter structure is shown in **Figure 16**.

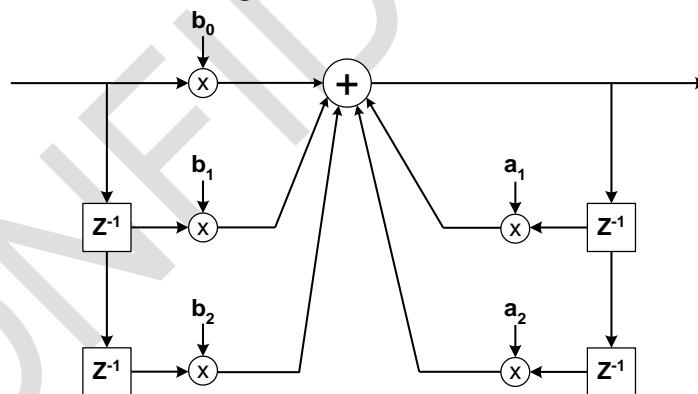

Figure 16. Bi-Quad Filter Structure

9.2. 3D Surround

3D surround expands the sound field of two channel stereo to the extent that is wider than the actual speaker spacing. Because this feature is acoustically valid for two channel signal, no other channels except channel 1/2 have this internal block.

NTP8835C realizes the 3D effect by combining delay and band-pass filter. At first, define the size of delay by using register address 0x0D. Possible maximum delay is 40 samples delay and this is about 0.4msec based on 96kHz signal input.

And then download the band-pass filter coefficients to internal memory of NTP8835C (same with the Bi-Quad filter coefficient download procedure). The BPF is two 2nd order IIR filter. Each channel can have different BPF. Change the 3D flag status of register address 0x7E to 'enable coefficient write' status and write the actual coefficient values to ten register addresses 0x0A~ 0x13. Also, internal 2x2

mixer helps ease of design. For using 3D mixer, download the gain values to two coefficient mode register addresses 0x3C~0x3D.

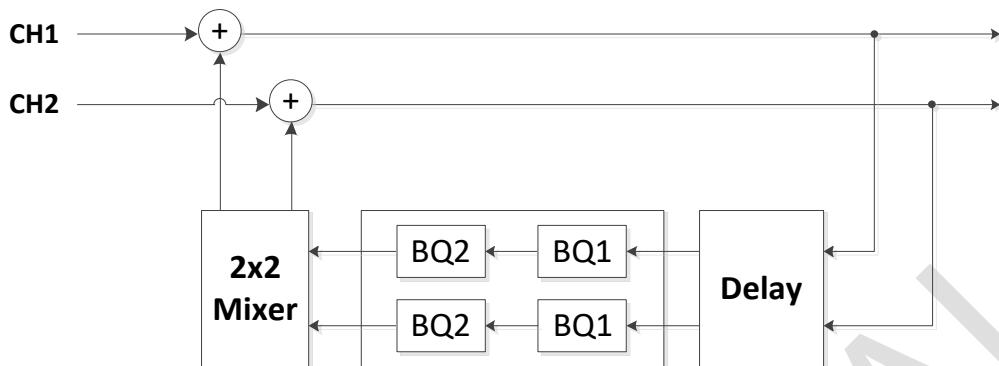

Figure 17. 3D Surround Structure

9.3. Configurable Graphic Equalizer

The NTP8835C provides 5 band graphic equalizer and PEQ to channel 1/2. EQ on/off can be selected by EQ flag of register address 0x0F.

The gains for each band can be controlled by writing the gain values (refer Graphic equalizer band gain table in **Appendix B**) to register addresses 0x10~14 respectively.

In PEQ the BQ1 ~ BQ5 can be used as programmable Bi-Quad filters.

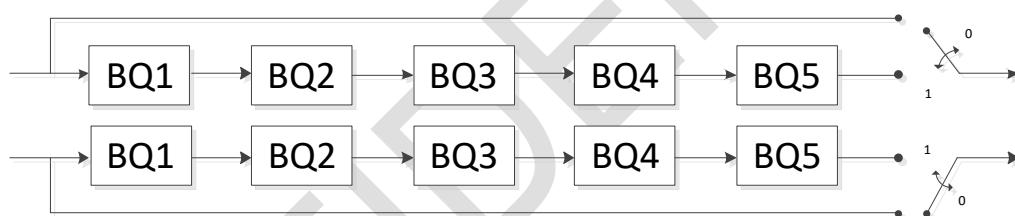

Figure 18. Configurable Graphic Equalizer

9.4. Post Bi-Quad Filter Chain

The post Bi-Quad filter chains of NTP8835C can be used in various purposes - bass management, loudness control, parametric EQ, loud-speaker EQ, etc. Independent filter design for channel 1/2 is possible and five 2nd order floating point parametric filters are linked serially. Especially for loudness control, as shown in **Figure 19**, last 3 filters are different from first 2 filters.

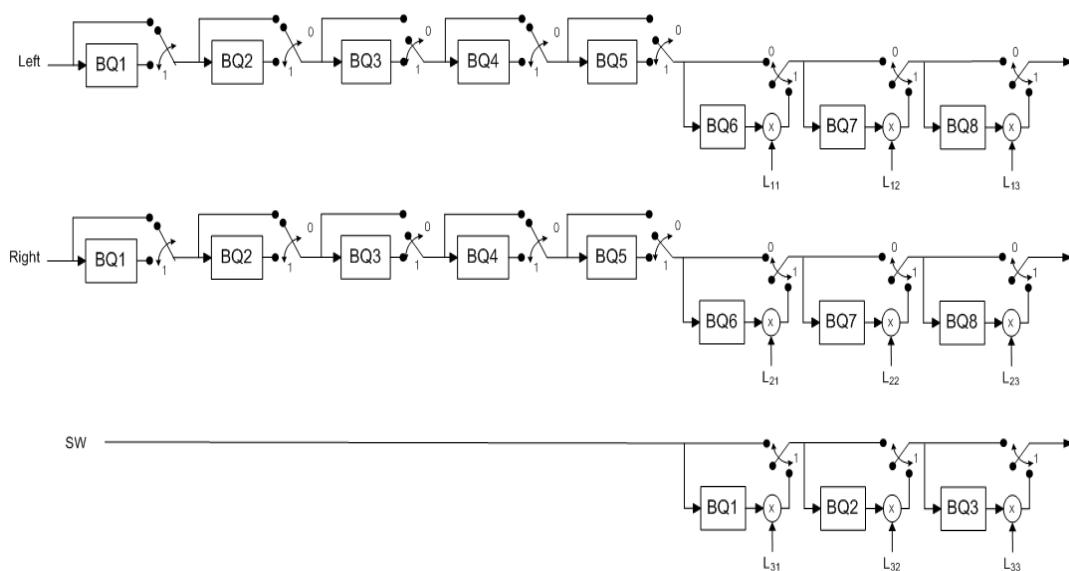

Figure 19. Post Bi-Quad Filter Structure

9.5. Loudness Control

The NTP8835C provides loudness control function using post Bi-Quad filter chains. Loudness control means the compensation of frequency characteristics in low volume level to fit the acoustic characteristics of human ears.

There are 3 Bi-Quad filters for loudness gain per each channel. To download a loudness gain of each Bi-Quad, the page flag register 0x7E should be set as same in the case of downloading the filter coefficients. The loudness gain values are applied for both channel 1 and 2 and when downloading the loudness gain values, a user should set the register 0x7E as 0x03.

Loudness Gains of CH1/CH2	Coefficient Mode Register Address		
	0x3E	0x3F	0x40
Register Address 0x7E= 0x03 case	L1	L2	L3

Loudness Gains of CH3	Coefficient Mode Register Address		
	0x1E	0x1F	0x20
Register Address 0x7E= 0x04 case	L1	L2	L3

Table 4. Address for Loudness Gain

10. VOLUME & DYNAMIC RANGE CONTROL

Master and channel volumes of the NTP8835C are independently controlled and softly changed. The register address 0x2E is the master volume control that affects 3 channels simultaneously and the address 0x2F, 0x30 and 0x31 correspond to the channel volume control register for channel 1, 2 and 3 respectively.

The possible maximum gain is +48.4375dB with using master volume fine control, master volume and channel volume because the master volume applies the gain to an input signal independent from a channel volume. However, in such a case, a clipping might occur to prevent a signal overflow error if the magnitude of the input signal is large enough to exceed 0dB under the combined volume setting.

10.1. Master Volume Control

By setting volume control register (Address 0x2E), master volume is controlled from negative infinity through 24dB with selectable step size as follows. For details on the master volume setting, see the register value table shown in **Appendix B**.

Step	Range
0.5 dB	+24 ~ -100 dB
10 dB	-100 ~ -150 dB

Table 5. Level Dependent Master Volume Steps

10.2. Channel Volume Control

By setting volume control registers (Address 0x2F~0x31), channel volumes are independently controlled from negative infinity through +24dB with two selectable step sizes as described below, and in the **Appendix B**, exact values for channel volume setting are described.

Step	Range
0.5 dB	+24 ~ -100 dB
10 dB	-100 ~ -150 dB

Table 6. Level Dependent Channel Volume Steps

10.3. Master Volume Fine Control

Fine control for master volume is possible (+0.0625dB step up to maximum +0.4375dB boost). Refer the register address 0x2D in the **Appendix A**.

10.4. Mute and Soft Volume Change

The NTP8835C enters mute state by setting soft mute flag of register address 0x26. Soft mute is implemented so that the volume gradually increases or decreases when mute is turned off or on respectively. Also the soft mute speed and soft volume change speed rates are programmable. Designers can minimize the pop noise by controlling the soft mute speed and volume change intervals. Refer SMH flag of register address 0x26 and SVI flag of register address 0x32.

10.5. Auto Mute

The NTP8835C can mute the sound automatically when the level of input audio signal is lower than the register-controlled threshold value. The mute can be done PWM switching with 50 % duty ratio in AD mode or with a high pulse duration of MLP width in D-BTL mode.

Auto mute is supported for internal all channels after 2x3 mixer block. Refer register address 0x33 and 0x34.

10.6. Dynamic Range Control

Dynamic range control can be turned on or off with programmable compression threshold and attack/release rates. The threshold parameters of DRC can be controlled separately for channel 1/2 and channel 3. For detailed setting, please refer to the register addresses 0x1C~0x25 and refer to the coefficient mode register addresses in Table 7.

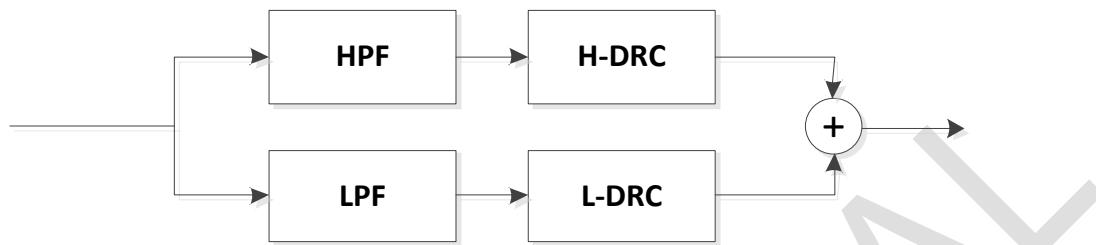

Figure 20. Block Diagram of Dynamic Range Control

2B' DRC Coefficient Mode Register Address	0x46 ~ 0x4A	0x4B ~ 0x4F	0x50 ~ 0x54	0x55 ~ 0x59	0x5A ~ 0x5E	0x5F ~ 0x63

Table 7. DRC Coefficient Mode Register Map for Dynamic Range Control

11. OUTPUT INTERFACE

11.1. Output Configuration

The output mode of the NTP8835C is 2.0 stereo reproduction mode and 2.1 reproduction mode. To produce proper output signal, register address 0x35~0x37 should be set to appropriate values.

11.2. AM Interference Relief Mode

The NTP8835C has AM interference reduction mode. In this mode SNR performance of NTP8835C can be degrade down to 90 dB and the PWM switching frequency is spread from 384kHz through 768kHz.

11.3. PWM Output Mapper

Any internal channel that produces a PWM output can be assigned to any PWM output hardware port (or pin) by mapping output port register. This feature is very helpful for the hardware designer because it can relieve difficulties in the power stage signal routing and channel assignment if the output channel order is fixed. See the register address 0x35~0x37 in the **Appendix A**.

11.4. Switching Output Mode

There are two selectable switching output modes in the NTP8835C. The difference between two output modes lies in the relationship of the relative signal pattern between PWM OUTxA and PWM OUTxB for a channel x. The first one is called as AD mode. This AD mode can be applied to both half bridge and full bridge output stage.

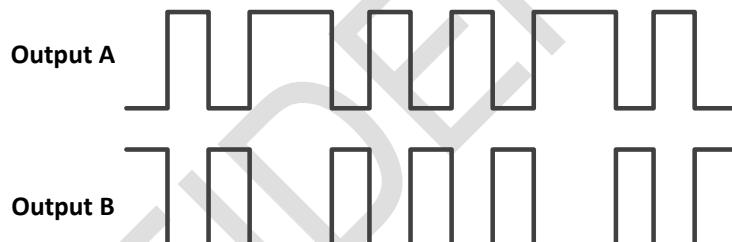

Figure 21. PWM Output Signals in AD Mode

AD asynchronous pair means the normal AD mode PWM output. In other words, A output and B output of each PWM output pair are mutually complementary. In the case of AD synchronous pair, A output and B output is perfectly identical, and its relation is not complementary. This is useful in some special case including single-ended power stage design.

The other one is called as NTX (Neo Trinity Amplification), which is D-BTL mode. This mode is applied only for BTL, and its operation is dynamically-biased BTL, compared to the normal BTL. An example of output signals in D-BTL mode is shown in **Figure 22**.

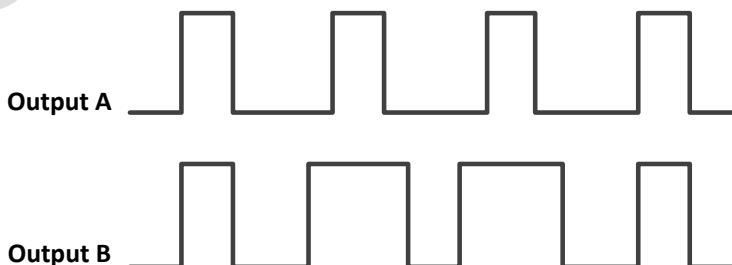

Figure 22. PWM Output Signals in D-BTL Mode

The MLP (Minimum Linear Pulse Length) parameter is an important characteristic in D-BTL mode. MLP defines the minimum pulse length that can guarantee a linear relationship between the input and output pulse length. Generally, the width of the output pulse is proportional to that of the input pulse. However, as the width of input pulse becomes narrower, such linear relation is not maintained due to the characteristic of a power device. The minimum MLP value is preferred as long as linear relationship between the input and the output pulse is satisfied. In addition, in terms of power consumption, a minimal MLP value is preferred.

This compensation is illustrated in **Figure 23**.

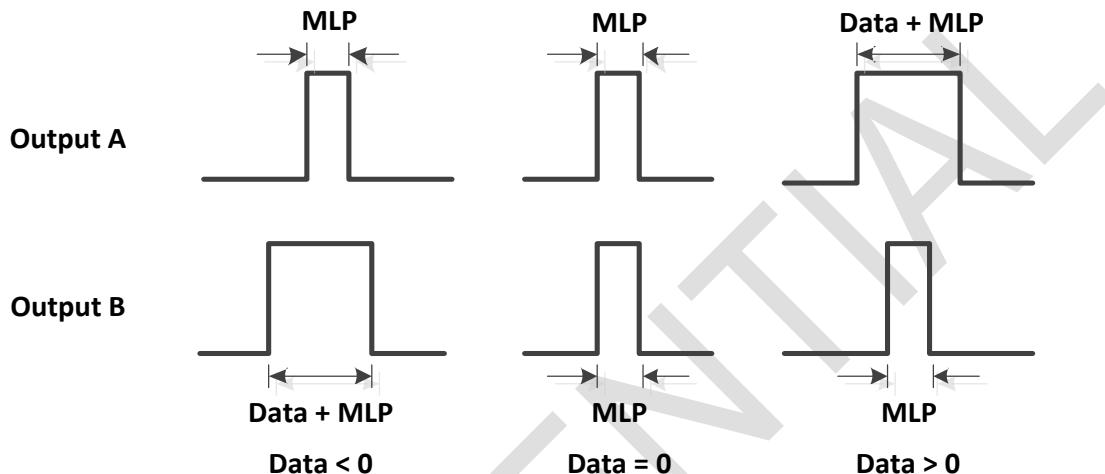

Figure 23. Compensation by MLP

11.5. Soft Start

The soft start operation reduces pop noise by controlling rapidly increased energy of PWM. To begin soft start operation, PWM soft start enable register (address 0x52: PSE) should be set to high, and then PWM switching on/off register (address 0x27: POF) should be set to low. The duty ratio of PWM output increases from 127:1 (Low:High) to 50:50 (Low:High). Step repeat time register (address 0x52: SRT) means repeat number of PWM output. Soft start operation with 17 repetitions is shown in the **Figure 24**.

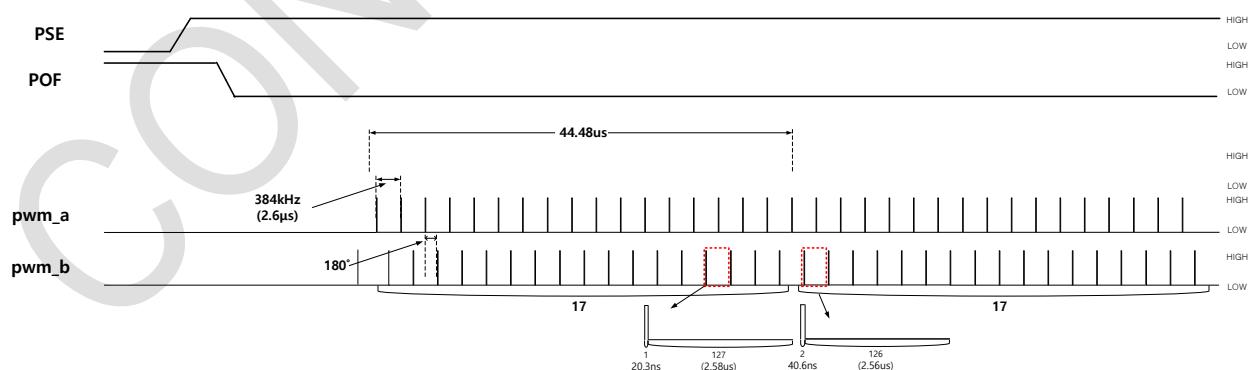

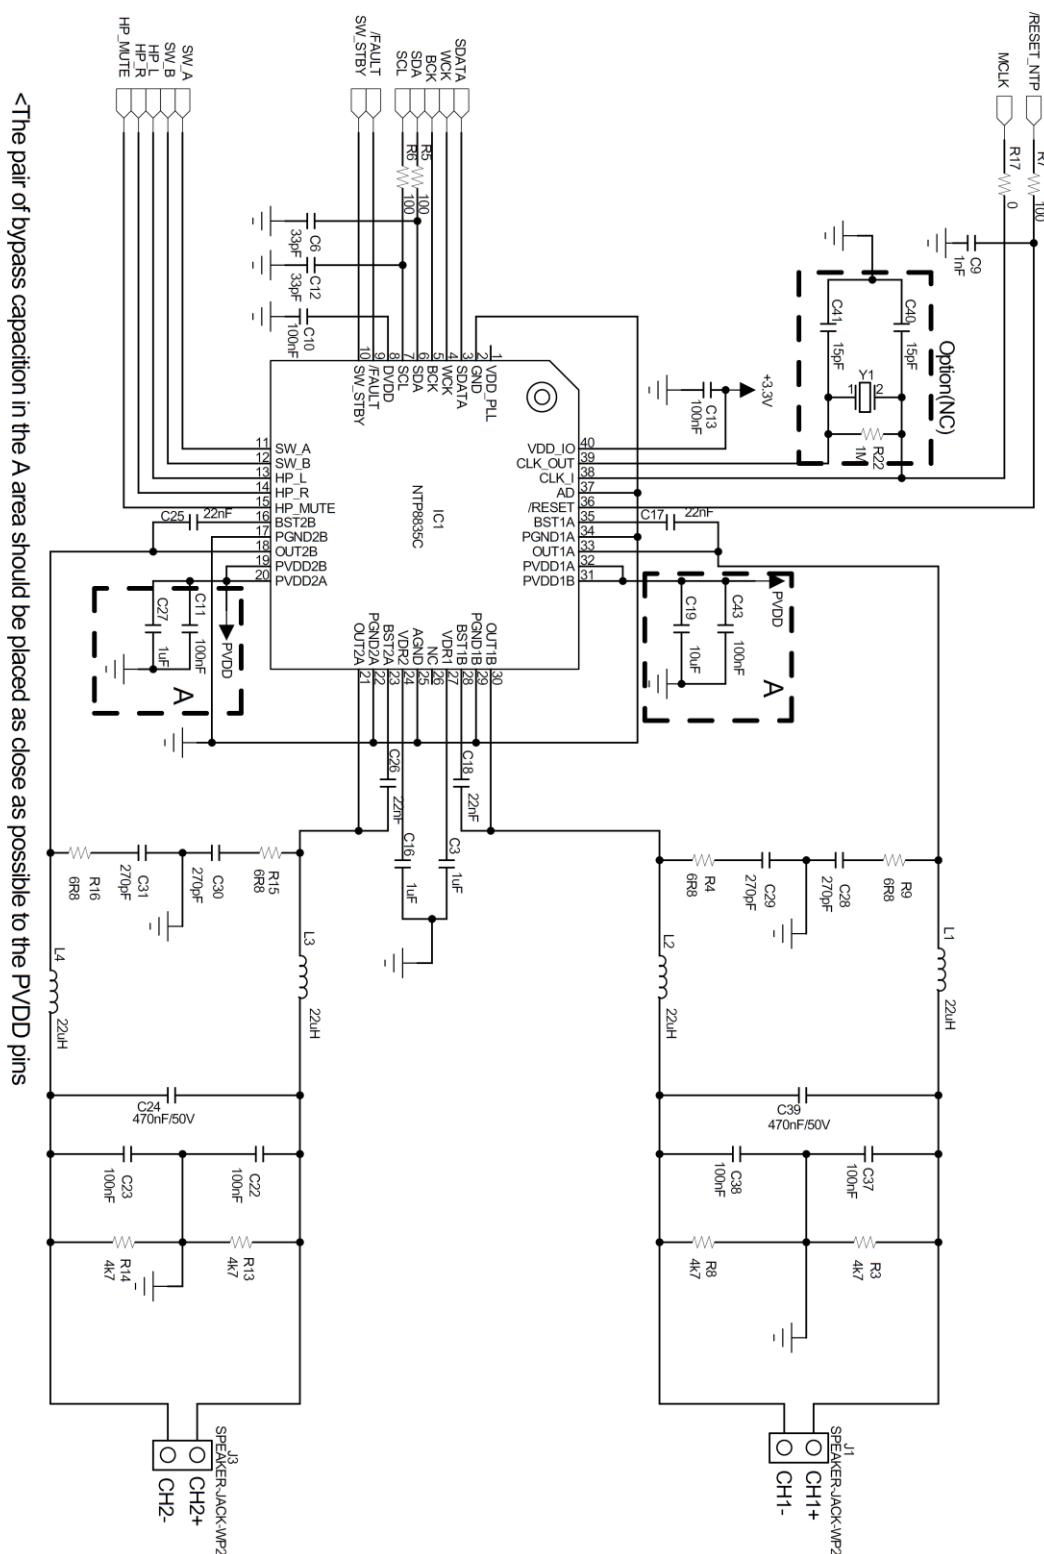

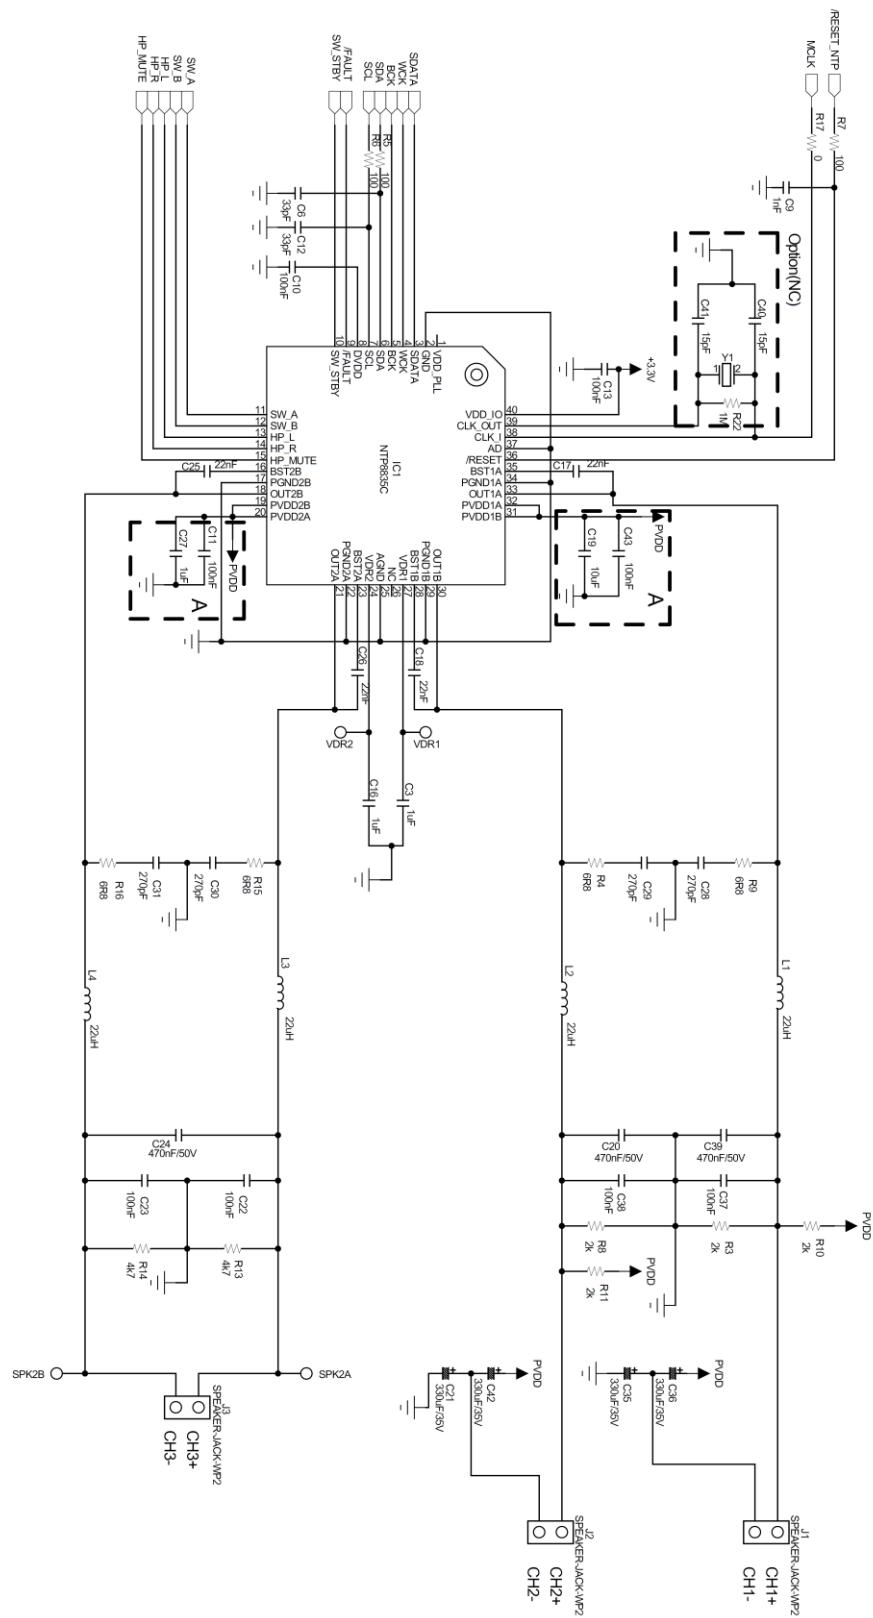

Figure 24. Soft Start Operation Timing

Addr 0x26: Soft Mute Control 0

Bit	7	6	5	4	3	2	1	0
Name	SMH	X	X	X	X	SM3	SM2	SM1

Name	Description	Value	Meaning	Ref.
SMn	Softmute	b'0	increase for channel n	
		b'1	decrease for channel n	
SMH	Softmute speed	b'0	42/46 msec(at 96/88.2kHz))	
		b'1	Hard change	

Addr 0x27: PWM Switching On/Off Control

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	POF3	POF2	POF1

Name	Description	Value	Meaning	Ref.
POFn	Switching output On/off control	b'0	Channel n PWM switching on	
		b'1	Channel n PWM switching off	

Addr 0x28: PWM_MASK Control 0

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	SRD	FPMRD	PWMM	

Name	Description	Value	Meaning	Ref.
PWMM	PWM MASK register	b'10	PWM MASK output is low. (reset default)	
		otherwise	PWM MASK output is high.	
FPMRD	Permanent PWM_MASK Low disable flag	b'0	No effect	
		b'1	Reset the auto_PWM_MASK_restore_counter to 0	
SRD	FAULT disable	b'0	FAULT is effect for PROTECT	
		b'1	FAULT is ineffective for PROTECT	

Addr 0x29: PWM_MASK Control 1

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	X	APM	POF

Name	Description	Value	Meaning	Ref.
POF	PWM off flag	b'0	Even if Auto PWM_MASK condition is met, the PWM output of all channel is not affected.	
		b'1	When Auto PWM_MASK condition is met, the PWM output of all channel goes to the defined state which is set by the PWM off state control register (Addr 0x2A).	
APM	PWM_MASK flag	b'0	Even if Auto PWM_MASK condition is met, the PWM_MASK output of all channel is not affected.	
		b'1	When Auto PWM_MASK condition is met, the PWM_MASK output goes to Low state.	

Addr 0x2A: PWM_MASK Control 2

Bit	7	6	5	4	3	2	1	0
Name	VMSK3	VMSK2	VMSK1	VMSK0	PMSK3	PMSK2	PMSK1	PMSK0

Name	Description	Value	Meaning	Ref.
PMSK	Masking bit of PWM off control	b'0	Mask bit indicating the validity of n-th bit of Addr 0x5E system register: If the n-th bit of this register is zero, the n-th bit of Addr 0x5E system register is invalid. The n-th bit of Addr 0x5E is valid only when the n-th mask bit is one.	
		b'1		
VMSK	Masking bit of PWM_MASK signal	b'0		
		b'1		

Addr 0x2B: PWM_MASK Control 3

Bit	7	6	5	4	3	2	1	0
Name	IRC		AVRCT		PHT			

Name	Description	Value	Meaning	Ref.
PHT	PWM_MASK Low Hold Time	b'000	0.5 msec Hold Time	
		b'001	1 msec Hold Time	
		b'010	2 msec Hold Time	
		b'011	4 msec Hold Time (Default)	
		b'100	8 msec Hold Time	
		b'101	16msec Hold Time	
AVRCT	Auto PWM_MASK Restore Counter Threshold	b'000	2	
		b'001	5 (Default)	
		b'010	10	
		b'011	15	
		b'100	20	
		b'101	25	
		b'110	30	
		b'111	Infinity	
IRC	Auto PWM_MASK Restore Interval Ratio Control	b'00	2 (Default)	
		b'01	4	

Addr 0x2C: PWM_MASK Control 4

Bit	7	6	5	4	3	2	1	0
Name	SHE	POE	X	X	X	HT2		

Name	Description	Value	Meaning	Ref.
HT2	Hold Time 2 apply start point (restore counter)	b'000	100 msec Hold Time	
		b'001	200 msec Hold Time	
		b'010	400 msec Hold Time	
		b'011	600 msec Hold Time (Default)	
		b'100	800 msec Hold Time	
		b'101	1 sec Hold Time	
		b'110	2 sec Hold Time	
POE	PWM off when Fault detected and PWM on when PWM_MASK Recover	b'0	Disable	
		b'1	Enable (Default)	
SHE	Second Hold time Enable	b'0	Disable (Default)	
		b'1	Enable	

Addr 0x2D: Master Volume Fine Control

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	MVFC		

Name	Description	Value	Meaning	Ref.
MVFC	Master volume fine control	h'0 ~ h'7	0 dB ~ 0.5 dB with 0.0625 dB step	

Addr 0x2E~0x31: Master Volume, and Ch1/2/3 volume, respectively

Bit	7	6	5	4	3	2	1	0
Name	VOL							

Name	Description	Value	Meaning	Ref.
VOL	Volume control	h'00 ~ h'FF	See volume control register tables. Reset default is 0 (0x00) (= -∞ dB) for Master and 207 (0xCF) for Channel	

Addr 0x32: Soft Volume Control

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	X	SVI	

Name	Description	Value	Meaning	Ref.
SVI	Soft volume change	b'00	Medium speed	
		b'01	High speed	
		b'10	Low speed	
		b'11	soft volume change disable	

Addr 0x33: Auto-Mute Control for CH1 & CH2

Bit	7	6	5	4	3	2	1	0
Name	X	EAMC	II		AT			

Name	Description	Value	Meaning	Ref.
AT	Auto-mute detection threshold	b'0000 ~ b'1111	Unsigned integer between 0 and 15	
II	Auto-mute response time	b'00	5 msec	
		b'01	50 msec	
		b'10	500 msec	
		b'11	2 sec	
EAMC	Effect of Auto-mute condition	b'0	Auto mute disable(No-Effect)	
		b'1	Continue switching if auto-mute	

Addr 0x34: Auto-Mute Control for CH3

Bit	7	6	5	4	3	2	1	0
Name	X	EAMC	II		AT			

Name	Description	Value	Meaning	Ref.
AT	Auto-mute detection threshold	b'0000 ~ b'1111	Unsigned integer between 0 and 15	
II	Auto-mute response time	b'00	5 msec	
		b'01	50 msec	
		b'10	500 msec	
		b'11	2 sec	
EAMC	Effect of Auto-mute condition	b'0	Auto mute disable(No-Effect)	
		b'1	Continue switching if auto-mute	

Reserved Addr 0x35~0x37

Addr 0x38: Miscellaneous PWM Control

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	POL	BHL	AHL	MD	

Name	Description	Value	Meaning	Ref.
MD	PWM output mode	b'00	AD mode with asynchronous signal pair	
		b'01	AD mode with synchronous signal pair	
		b'10	PWM D-BTL MODE (see 0x4E)	
		b'11	AM Interference mode	
AHL	A-out state When switching off	b'0	Low	
		b'1	High	
BHL	B-out state when switching off	b'0	Low	
		b'1	High	
POL	Ch3 polarity Control	b'0	Normal	
		b'1	Inverse	

Addr 0x39: I²C Glitch filter

Bit	7	6	5	4	3	2	1	0
Name	GFO	DUR						

Name	Description	Value	Meaning	Ref.
DUR	glitch width	b'000 0000 ~ b'111 1111	minimum pulse width = DUR + 20 ns reset default = 15 * 10 ns (DUR default = b'0001111)	
GFO	Glitch filter enable/disable	b'0	Glitch filter on	
		b'1	Bypass	

Addr 0x3A: Headphone Mute Control

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	X	X	HP_MUTE

Name	Description	Value	Meaning	Ref.
HP_MUTE	Use this register to mute external headphone	b'0	Default. External headphone is muted by active low signal	
		b'1	External headphone is muted by active high signal.	

Reserved Addr 0x3B~0x49**Addr 0x4A: SE Soft Start Control 0**

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	X	X	SSE

Name	Description	Value	Meaning	Ref.
SSE	SE_STE	b'0	SE Soft Start Disable (SE Normal Start)	
		b'1	SE Soft Start Enable	

Addr 0x4B: SE Soft Start Control 1

Bit	7	6	5	4	3	2	1	0
Name	X	SSC						

Name	Description	Value	Meaning	Ref.
SSC	SE_CHARGE_TIME	h'00 ~ h'7F	PWM output delay time from point of PWM STBY signal to high. The unit of 1bit is 10ns. (default : 0x22)	

Addr 0x4C: SE Soft Start Control 2

Bit	7	6	5	4	3	2	1	0
Name	X	SSR						

Name	Description	Value	Meaning	Ref.
SSR	SE_REPEAT	h'01 ~ h'FF	The repeat time of se soft start (default: 1 – means repeat 1 times)	

Addr 0x4D: SE Soft Start Control 3

Bit	7	6	5	4	3	2	1	0
Name						SPD		

Name	Description	Value	Meaning	Ref.
SPD	SE_PERIOD	h'01 ~ h'7E	Half period of PWM output start point. The unit of 1bit is 10ns. (default : 0x01 – means half period 20ns)	

Addr 0x4E: PWM D-BTL MODE Control 0

Bit	7	6	5	4	3	2	1	0
Name	X	MLP						

Name	Description	Value	Meaning	Ref.
MLP	Minimum Linear pulse length	h'08	Range : Minimum Pulse Width ~ 640ns, 20ns step.(refer Addr 0x55 for Minimum Pulse Width)	

Reserved Addr 0x4F**Addr 0x50: PWM D-BTL Mode Control 1**

Bit	7	6	5	4	3	2	1	0
Name	X						NSS	

Name	Description	Value	Meaning	Ref.
NSS	NS Select	b'00	7bits NS (AD mode)	
		b'01	Reserved	
		b'10	8bits NS	
		b'11	New 8bits NS (D-BTL mode)	

Reserved Addr 0x51**Addr 0x52: PWM Soft Start**

Bit	7	6	5	4	3	2	1	0
Name	PSE	SRT						

Name	Description	Value	Meaning	Ref.
SRT	Step Repeat Time	b'000 0000 ~ b'111 1111	The repeat time of each step (default : b'0010000 – means repeat 17 times)	
PSE	BTL PWM soft start Enable	b'0	Disable	In Single Ended Mode, should be disabled
		b'1	Enable (Default)	

Addr 0x53: Power Meter Control

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	PDPOS	X	X	PDCH	

Name	Description	Value	Meaning	Ref.
PDCH	Power meter Detect Channel	b'00	L+R (default)	
		b'01	L channel	
		b'10	R channel	
		b'11	reserved	
PDPOS	Power meter Detect Position	b'0	After volume (default)	
		b'1	Before volume	

Addr 0x54: Power Meter (read-only)

Bit	7	6	5	4	3	2	1	0
Name	0	0	0	0	0	0	0	0

Addr 0x55: Modulation Index & NS-Type Control

Bit	7	6	5	4	3	2	1	0
Name	X	M0		NT	MD3		MD12	

Name	Description	Value	Meaning	Ref.
MD12	Modulation index control by Minimum pulse width for Ch 1&2	b'00	Minimum pulse width = 80ns	
		b'01	Minimum pulse width = 60ns	
		b'10	Minimum pulse width = 40ns	
		b'11	Minimum pulse width = 20ns	
MD3	Modulation index control by Minimum pulse width for Ch 3	b'00	Minimum pulse width = 80ns	
		b'01	Minimum pulse width = 60ns	
		b'10	Minimum pulse width = 40ns	
		b'11	Minimum pulse width = 20ns	
NT	Noise shaping Type for Ch 1&2	b'0	Type 1 (fourth order)	
		b'1	Type 2 (fifth order)	
M0	Dither Position Selector	b'00	No left shift on dither value = Dither off	
		b'01	1bit left shift on dither value	
		b'10	2bit left shift on dither value	
		b'11	3bit left shift on dither value	

Addr 0x56: ASRC Control 0

Bit	7	6	5	4	3	2	1	0
Name	X	X	DCESW	X	FSFHM	FSFSM	X	BYPASS

Name	Description	Value	Meaning	Ref.
BYPASS	Bypass	b'0	Normal operation	
		b'1	Bypass	
FSFSM	frequency stable effect on soft mute flag	b'0	no effect on soft mute flag	
		b'1	soft mute flag = 1 when unstable state	
FSFHM	frequency stable effect on hard mute flag	b'0	no effect on hard mute flag	
		b'1	hard mute flag = 1 when unstable state	
DCESW	DC Check Enable of SRC WCK	b'0	DC Check Disable in SRC WCK	
		b'1	DC Check Enable in SRC WCK	

Reserved Addr 0x57~0x5D**Addr 0x5E: System Error Status (read-only)**

Bit	7	6	5	4	3	2	1	0
Name	FSI				MPW	LSRC	ULCK	PPM

Name	Description	Value	Meaning	Ref.
PPM	Permanent PWM_MASK Indication flag	b'0		
		b'1	Indicated that PWM_MASK is in Permanent LOW state	
ULCK	Sampled PLL Unlock error	b'0	PLL is locked state.	
		b'1	PLL is unlocked state.	
LSRC	SRC lock status	b'0	SRC is unlocked state.	
		b'1	SRC is locked state	
MPW	MCK/WCK Ratio error	b'0	Ratio is incorrect.	
		b'1	Ratio is correct.	
FSI	Sampling Frequency Information	b'0000	8 kHz	
		b'0001	11.025 KHz	
		b'0010	12 kHz	
		b'0011	16 kHz	
		b'0100	22.025kHz

		b'0111	Reserved	
		b'1000	SDATA_OUT => Monitor 1 pin	

Addr 0x61: I2S Glitch Filter

Bit	7	6	5	4	3	2	1	0
Name	GFE	WTH						

Name	Description	Value	Meaning	Ref.
WTH	glitch width	b'00000000 ~ b'11111111	minimum pulse width = DUR + 20 ns reset default = 1 * 10 ns (DUR default = b'0000001)	
		b'0	Glitch filter on	
GFE	Glitch filter enable/disable	b'1	Bypass	

Addr 0x62: Driver Control

Bit	7	6	5	4	3	2	1	0	
Name	X	X	X	SB	PM		STBY_SEL	SHDN	
SHDN	Shutdown		b'0	SHDN pin go to high					
				SHDN pin go to low					
STBY_SEL	STBY signal output mode		b'0	STBY : SB & PWM_MASK					
				STBY : SB					
PM	PWM Mode		b'00	Normal Operation					
			b'01	1 chip 2.1 channel mode (Single Ended Mode) cf) Should be disable 0x52 PSE					
			b'10	1 chip 2.0 channel mode or 2.1 channel with external power stage (BTL Mode) cf) Should be disable 0x4A SSE					
SB	Stand-by in 2 channel mode		b'0	Power Device: Stand-by operation					
			b'1	Power Device: Normal operation					

Reserved Addr 0x63~0x65

Addr 0x66: Power-Die Status (Read-Only)

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	X	PDS	

Name	Description	Value	Meaning	Ref.
PDS	Power-Die Status	b'00	Normal State	
		b'01	Temperature Protection Error	
		b'10	Voltage Protection Error	
		b'11	Current Protection Error	

Reserved Addr 0x67~0x7D

Addr 0x7E: Bi-Quad Filter Coefficient Page

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	PEQ	CH3	CH2	CH1

Name	Description	Value	Meaning	Ref.
CH1	Coefficient write enable	b'0	Disable coefficient write for ch1	
		b'1	Enable coefficient write for ch1	
CH2	Coefficient write enable	b'0	Disable coefficient write for ch2	
		b'1	Enable coefficient write for ch2	
CH3	Coefficient write enable	b'0	Disable coefficient write for ch3	
		b'1	Enable coefficient write for ch3	
PEQ	Coefficient write enable	b'0	Disable coefficient write for PEQ	
		b'1	Enable coefficient write for PEQ	

Ref) In convenience, a device programmer can write same biquad filter coefficients for CH1 and CH2 at a single time by setting Reg 0x7E as "x03".
